Colloids presentation slides 1. COLLOIDS BY DEVI PRIYA SUGATHAN MSc 2. COLLOIDS A colloid is a substance microscopically dispersed throughout another substance. The word colloid comes from a Greek word 'kolla', which means glue thus colloidal particles are glue like substances. These particles pass through a filter paper but not through a semipermeable membrane. Colloids can be made settle by ...

Chapter 10 Colloids and Colloidal Stability

Colloids. Colloids (also known as colloidal solutions or colloidal systems) are mixtures in which microscopically dispersed insoluble particles of one substance are suspended in another substance. The size of the suspended particles in a colloid can range from 1 to 1000 nanometres (10^{-9} metres). For a mixture to be classified as a colloid, its suspended particles must not settle (in the manner that the particles of suspensions settle at the bottom of the container if left undisturbed).

Definition of Colloidal Solution. The heterogeneous mixture of two or more substances, where the size of the particles lies between 1- 1000 nm, is known as a colloidal solution. The colloidal solution is the intermediate between true solution and suspension, though it is also in the liquid phase.

A colloidal solution is a type of a mixture which consists of particles whose size varies between 1 to 1000 nanometers. In colloidal solution the particles are distributed evenly. During this process the particles do not settle down. This is one of the best know thing about colloidal solutions.

A colloid is a mixture in which one substance of microscopically dispersed insoluble particles are suspended throughout another substance. Sometimes the dispersed substance alone is called the colloid. The colloid consists of a dispersed phase and a continuous phase. Unlike solutions, colloids do not constitute a solute dissolved in the solvent ...

Anionic (e.g., Na. lauryl sulfate) 2. Cationic (e.g., cetyl triethylammonium bromide) 3. Nonionic (e.g., polyoxyethylene lauryl ether) 4.

Classification. Because the size of the dispersed phase may be difficult to measure, and because colloids have the appearance of solutions, colloids are sometimes identified and characterized by their physico-chemical and transport properties. For example, if a colloid consists of a solid phase dispersed in a liquid, the solid particles will not diffuse through a membrane, whereas with a true ...

Colloid - Wikipedia

Colloidal dispersions consist of particles that are much bigger than the solutes of typical solutions. Colloidal particles are either very large molecules or aggregates of smaller species that usually are big enough to scatter light.
