Background. Tensile and compressive stresses increase proportionally with bending moment, but are also dependent on the second moment of area of the cross-section of a beam (that is, the shape of the cross-section, such as a circle, square or I-beam being common structural shapes). Failure in

Using the Jones calculus for the optical polarizer ... If the centers of molecules are separated by a vector r_{ij} and the molecular axes are oriented along unit vectors e_i and e_j , then the force on molecule i due to j reads $f_{ij} = \frac{1}{r_{ij}^3} v_{ij}$. Using the chain rule, we obtain $f_{ij} = \frac{1}{r_{ij}^3} v_{ij} = \frac{1}{r_{ij}^3} \frac{d}{dt} r_{ij} = \frac{1}{r_{ij}^3} \frac{d}{dt} (r_{ij} e_i) = \frac{1}{r_{ij}^3} (v_{ij} e_i + r_{ij} \dot{e}_i) = \frac{1}{r_{ij}^3} v_{ij} e_i + \frac{1}{r_{ij}^2} v_{ij} \dot{e}_i \dots$
