Practice Codominance And Incomplete Dominance

Incomplete dominance is when the phenotypes of the two parents blend together to create a new phenotype for their offspring. An example is a white flower and a red flower producing pink flowers. Codominance is when the two parent phenotypes are expressed together in the offspring.

Incomplete Dominance vs Codominance: What's the Difference?

Closely related to incomplete dominance is codominance, in which both alleles are simultaneously expressed in the heterozygote. We can see an example of codominance in the MN blood groups of humans (less famous than the ABO blood groups, but still important!). A person's MN blood type is determined by his or her alleles of a certain gene.

1. Incomplete dominance governs the pigment gene of a flower. A mating between heterozygotes yields the following phenotypic ratio: 15 red flowers, 32 pink flowers and 14 white flowers.

Codominance and incomplete dominance are two mechanisms whose patterns of inheritance cannot be explained by the laws of Mendelian inheritance. Both codominance and incomplete dominance are caused by intragenic (allelic) gene interactions. Both codominance and incomplete dominance occur during the inheritance of a pair of heterozygous alleles.
